A Systematic Description of the Wobbling Motion in Odd-Mass Nuclei Within a Semi-Classical Formalism

PhD Candidate
Robert Poenaru[1,2]

Scientific Supervisor
Prof. Dr. Em. A. A. Raduta[2]

[1]Doctoral School of Physics, UB
[2]Department of Theoretical Physics, IFIN-HH

A presentation for the degree of Doctor of Philosophy

May 17, 2023

Outline

Aim

Research Objectives

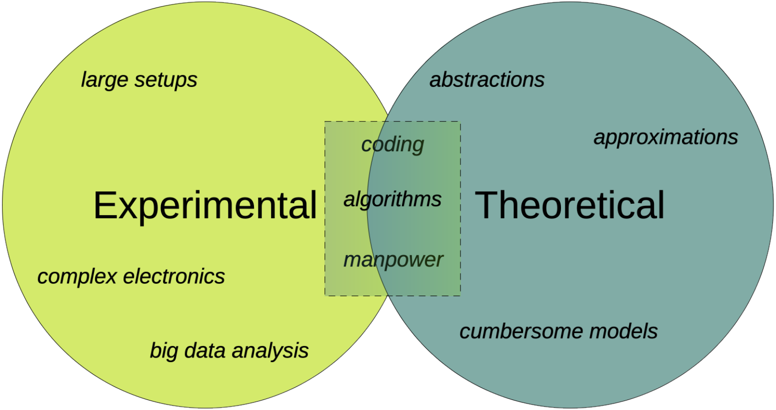
- Extend the current interpretation of the **Nuclear Triaxiality** in the context of its unique fingerprint: **Wobbling Motion**.
- Adopt a framework that is as close as possible to a **classical picture**.

Objectives exclusive to the thesis

- Sufficient context for a better understanding of the underlying concepts, methods, and results.
- create a completely *open-source* project .

Motivation

- **Nuclear Triaxiality** recently became a *hot topic* within the scientific community.
- Identifying nuclei with triaxial deformations represents a real **experimental** and **theoretical** challenge.



Outline

Nuclear Deformation

Nuclear shapes

Most generally described in terms of the **nuclear radius**:

$$R(\theta,\varphi) = R_0\left(1+\sum_{\lambda=0}^{\infty}\sum_{\mu=-\lambda}^{\lambda}\alpha_{\lambda\mu}Y_{\lambda}^{\mu}(\theta,\varphi)\right)$$

Quadrupole deformations $\lambda = 2$

- For us: Most relevant modes are the **quadrupole vibrations** $\lambda = 2$ $\Longrightarrow$ *Play a crucial role in the rotational spectra of nuclei:*
- $\alpha_{2\mu}$ reduced to only two *deformation parameters*: β_2 (**eccentricity**) and γ (**triaxiality**) (*Bohr and Mottelson, 1969*).

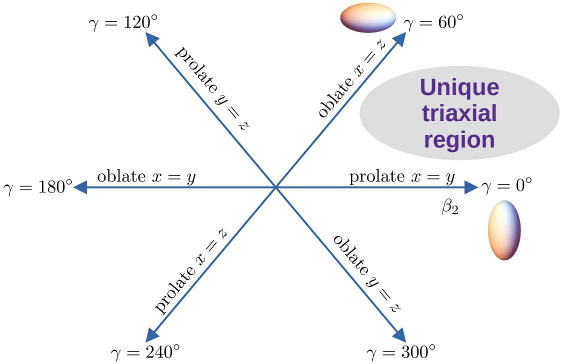
Axial shapes

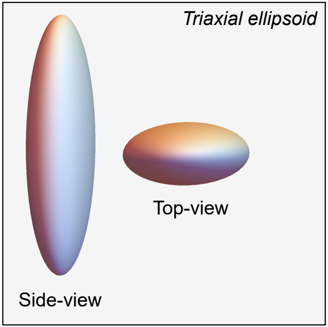
- Most of the nuclei are either **spherical** or **axially symmetric** in their ground-state.
- Nuclear moments of inertia $\mathcal{I}_{1,2,3}$: only two are equal.

Figure: **spherical:** $\beta_2 = 0$ **prolate:** $\beta_2 > 0$ **oblate:** $\beta_2 < 0$. ($\gamma = 0^\circ$).

Non-axial shapes

- The triaxiality parameter $\gamma \neq 0°$: departure from axial symmetry.
- Moments of inertia: $\mathcal{I}_1 \neq \mathcal{I}_2 \neq \mathcal{I}_3$.





Outline

Fingerprints of Triaxiality

Evidence

- Currently, there are **only two** well-established phenomena uniquely attributed to triaxial deformation.
  1. **Wobbling Motion** - WM (*Bohr and Mottelson, 1970s*)
  2. Chiral Motion - χM (*Frauendorf, 1997*)
- These two can be measured/detected experimentally.

Goal

Describe the elusive character of Wobbling Motion in the context of nuclear triaxiality.

Probing triaxiality in nuclei

Triaxial nuclei can be observed/obtained in several experiments:

- Nuclear fission: $A \rightarrow B + C$
- Nuclear fusion: $X + Y \rightarrow Z$
- **Fusion-evaporation reactions**: Long-lived + enhanced deformation

$$Beam(N_1, E) + Target(N_2) \longrightarrow N_3^* \rightarrow \cdots \rightarrow triaxial(N_4)$$

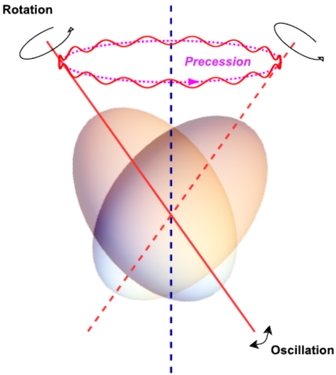
Wobbling Motion

$\gamma \neq 0^\circ$

MOI anisotropy

main rotation around $\mathcal{J}_{\max}$ is disturbed by the other two axes



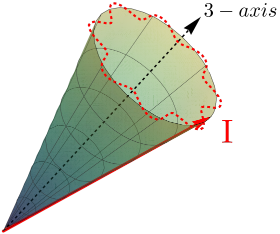
Wobbling Effect

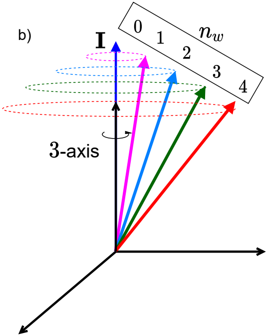
- The **total angular momentum** of the nucleus **precesses** and **oscillates** around $\mathcal{J}_{\max}$.

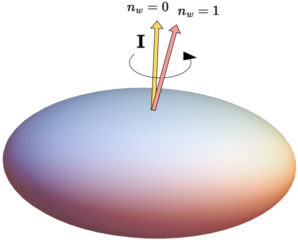
Wobbling Motion

Harmonic oscillation

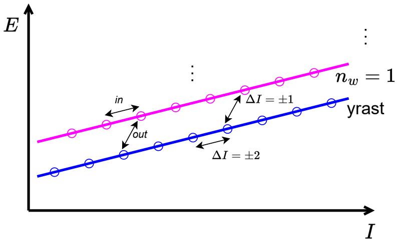
- Precession of **I** is affected by **rotational frequency** and/or **tilting**
- Tilting only by "specific" amount → **harmonic character** → **wobbling phonon**: $n_w = 0, 1, 2, \ldots$.

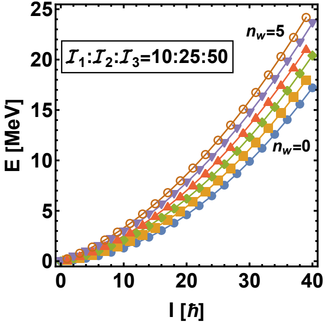


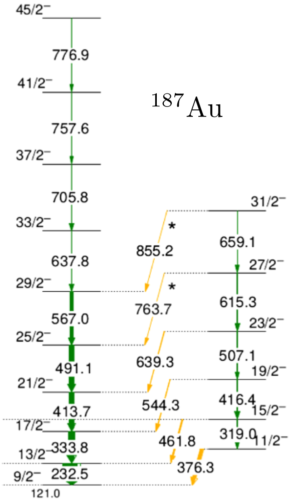




Wobbling Motion II



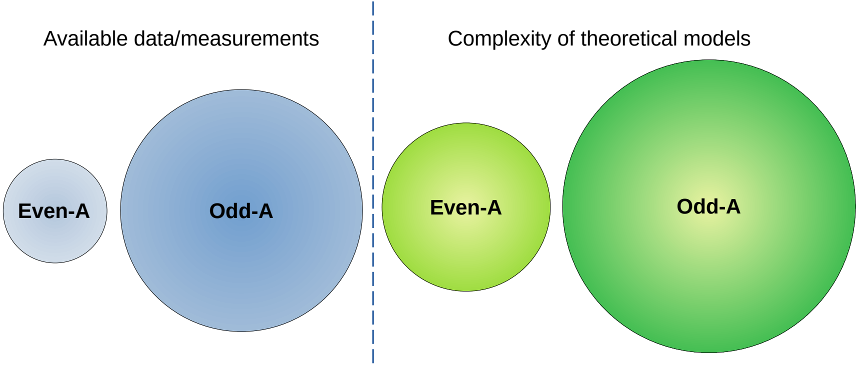




Sensharma, 2020.

Even-A vs. Odd-A Picture

- Predicted for even-A nuclei more than 50 years ago.
- First experimental evidence: ^{163}Lu (*Ødegård, 2001*).
- Current mass-regions for wobblers: $A \approx [130, 160, 180]$.



Wobbling Motion in ^{130}Ba

Experimental measurements show **two** wobbling bands (*Petrache et. al. 2019*).

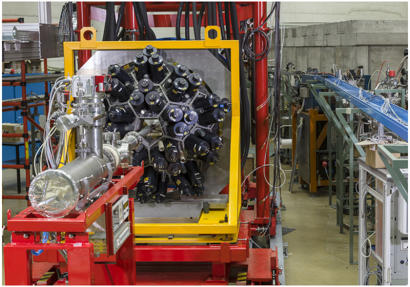
Harmonic formalism

Harmonic Approximation (*Bohr & Mottelson, 1969*):

$$E_{I,n_w} = A_3 I(I+1) + \hbar\omega_w\left(n_w + \frac{1}{2}\right),$$

$$A_3 = (2\mathcal{I}_3)^{-1}.$$

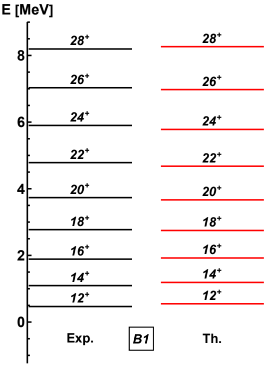
(rotational term + wobbling frequency)

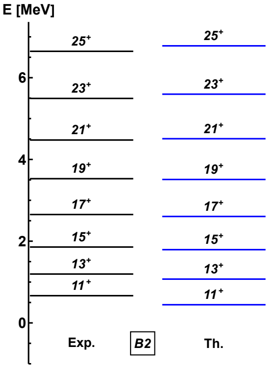


GALILEO, LNL, *Source: lnl.infn.it*

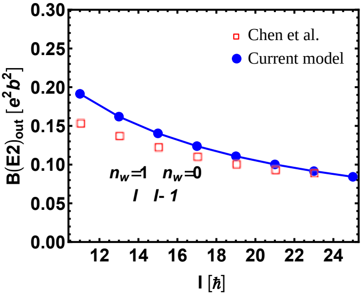
Fusion evaporation: ^{13}C beam of $E = 65$ MeV and ^{122}Sn target.

Results for ^{130}Ba





$\mathcal{P}_{\text{fit}}$			
$\mathcal{I}_1$	$\mathcal{I}_2$	$\mathcal{I}_3$	Unit
27	22	**43**	$\hbar^2\text{MeV}^{-1}$



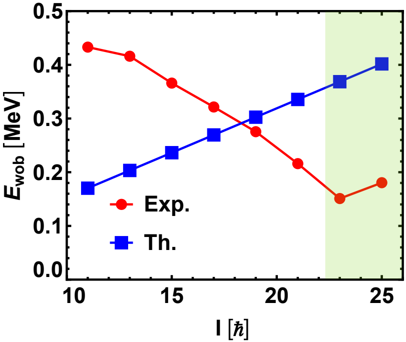
Results presented at the international conference NSP-2022, Turkey.

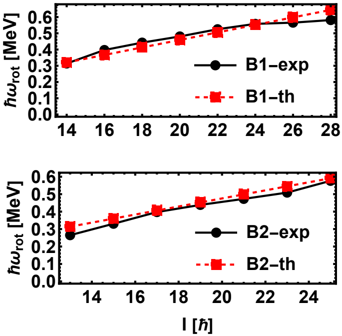
Results for ^{130}Ba II

Excitation energies vs. **Wobbling Energies**:

$$E_{\text{wob}}(I_{\text{even}}) = E_{I,n} - E_{I,0}\ ,$$

$$E_{\text{wob}}(I_{\text{odd}}) = E_{I,n} - \frac{1}{2}\left(E_{I-1,0} + E_{I+1,0}\right)$$





Results presented at the international conference NSP-2022, Turkey.

Outline

Starting Point

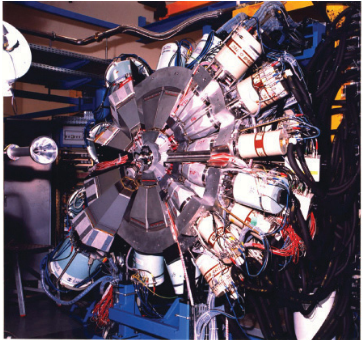
A. A. Raduta, **R. Poenaru**, L. Gr. Ixaru, PRC, 2017 + A. A. Raduta, **R. Poenaru**, Al. H. Raduta, JPG, 2018→$\mathbf{W}_0$ in the thesis.

Framework

- **First semi-classical description** for the ^{163}Lu, using the **Particle-Rotor-Model** (*Hamamoto, 2002*).

PRM

An odd-nucleon moving in a quadrupole deformed mean field generated by an even-even triaxial core.



Euroball IV, Strasbourg, *Source: technologysi.stfc.ac.uk*

Fusion evaporation: ^{29}Si beam of $E = 152$ MeV and ^{139}La target.

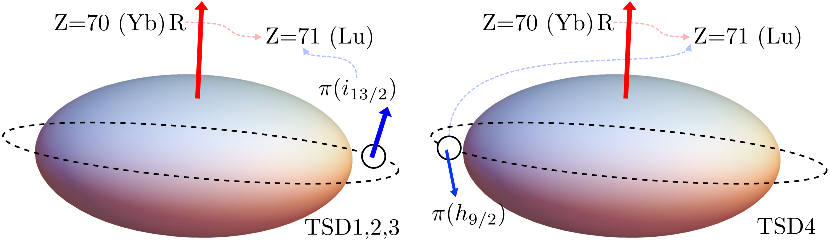
Fresh-Up 1: $\mathbf{W}_1$

Particle-Rotor Model Hamiltonian for an odd-A nucleus:

$$\hat{H} = \hat{H}_{\text{rot}} + \hat{H}_{\text{sp}} \ , \ \ \hat{H}_{\text{rot}} = \sum_{k=1}^{3} A_k(\hat{I}_k - \hat{j}_k)^2,$$

$$\hat{H}_{\text{sp}} = \epsilon_j + \frac{V}{j(j+1)}\left[\cos\gamma\left(3\hat{j}_3^2 - \mathbf{j}^2\right) - \sqrt{3}\sin\gamma\left(\hat{j}_1^2 - \hat{j}_2^2\right)\right].$$

V - single-particle potential strength $\propto \beta_2$ (*Tanabe, 2017*)



A.A. Raduta, **R. Poenaru**, C.M. Raduta, Journal of Physics G 47, 2020.

Variational Principle + Eqs. of Motion

Time-Dependent Variational Equation

$$\delta \int_0^t \langle \Psi_{IM;j} | \hat{H} - i\frac{\partial}{\partial t'} | \Psi_{IM;j} \rangle \, dt' = 0$$

$$\Psi_{\text{trial}} \equiv |\Psi_{IM;j}\rangle = \mathcal{N} e^{z\hat{I}_-} \cdot e^{s\hat{j}_-} |IMI\rangle \otimes |jj\rangle$$

- $(z, r, \varphi, \hat{I}, |IMI\rangle)$ - core (rotor **R**)
- $(s, f, \psi, \hat{j}, |jj\rangle)$ - single-particle (**j**)
- $\{z, s\}$ $\rightarrow$ **phase space coordinates**

Constant of motion:

$$\mathcal{H} \equiv \langle \Psi_{IM;j} | \hat{H} | \Psi_{IM;j} \rangle$$

Canonical equations of motion:

$$\mathcal{S}_1 : \frac{\partial \mathcal{H}}{\partial r} = \dot{\varphi} \, , \; \frac{\partial \mathcal{H}}{\partial \varphi} = -\dot{r}$$

$$\mathcal{S}_2 : \frac{\partial \mathcal{H}}{\partial f} = \dot{\psi} \, , \; \frac{\partial \mathcal{H}}{\partial \psi} = -\dot{f}$$

The two sets of Hamilton equations are **the semi-classical description** of the initial quantal $\hat{H}$.

Wobbling frequency

Solving $\mathcal{S}_1$ and $\mathcal{S}_2$ leads to the algebraic equation:

$$\Omega^4 + B\Omega^2 + C = 0$$

four solutions $\longrightarrow$ **only two are real**:

$$\Omega_{1,2} = \left[\frac{1}{2}\left(-B \mp \sqrt{B^2 - 4C}\right)\right]^{1/2}$$

- Ω_1: wobbling frequency of the even-A core **R**
- Ω_2: wobbling frequency of the odd-nucleon **j**
- **Two wobbling phonon numbers:** n_{w_1} **and** n_{w_2}

A.A. Raduta, **R. Poenaru**, C.M. Raduta, Journal of Physics G 47, 2020.

Energy spectrum

Spectra of odd-A nuclei within $\mathbf{W}_1$

$$E_{I,n_1,n_2} = \epsilon_j + \mathcal{H}^I_{\text{min}} + \mathcal{F}^I_{n_{w_1}n_{w_2}}$$

- Phonon factor:

$$\mathcal{F}^I_{n_{w_1}n_{w_2}} = \hbar\Omega^I_1\left(n_{w_1} + \frac{1}{2}\right) + \hbar\Omega^I_2\left(n_{w_2} + \frac{1}{2}\right)$$

- $\mathcal{H}^I_{\text{min}}$ - Classical Energy Function taken in its minimum point: $p_0 = (0, I; 0, j)$.
- ϵ_j - single-particle energy

A new interpretation for TSD1 and TSD2

Previous models

$TSD1 =$ zero-phonon wobbling band
$TSD2 =$ one-phonon wobbling band...

Redefinition

$TSD1$ and $TSD2$ are **Signature Partner Bands** (in favor of Ultimate Cranker calculations, *Jensen, 2004*).

$$\left(\alpha_{fav} = +\frac{1}{2}\right) : \{TSD1\} \equiv \left\{\left[0^+, 2^+, 4^+, \ldots\right] \otimes [j^\pi = 13/2^+]\right\}$$
$$\left(\alpha_{unfav} = -\frac{1}{2}\right) : \{TSD2\} \equiv \left\{\left[1^+, 3^+, 5^+, \ldots\right] \otimes [j^\pi = 13/2^+]\right\}$$

$TSD4$ is a **ground-state wobbling band**, $\pi(h_{9/2})$ configuration.

A.A. Raduta, **R. Poenaru**, C.M. Raduta, Journal of Physics G 47, 2020.

A new band structure for ^{163}Lu

Band	Spins	π	α	$\pi(I_j)$	$\mathbf{W_0}$: $\mathscr{C}+\mathscr{Q}_p$	$\mathbf{W_1}$: $\mathscr{C}+\mathscr{Q}_p$

$\mathbf{W}_1$ — Remarks

Characteristics

- **+** Full semi-classical description (TDVE) with good numerical results
- **+** Deformation parameters are self-consistent (agree with exp. values)
- **−** separate fit for TSD4 (different nucleonic configuration)
- **−** Two sets of MOIs for ^{163}Lu

Onset of another redesign

Start of $\mathbf{W}_2$ formalism in Chapter 5

Fresh-Up 2: $\mathbf{W}_2$

Novel description of ^{163}Lu

- All four bands in ^{163}Lu described by the same triaxial core + odd-particle coupling $\longrightarrow \mathcal{Q}_1 = \pi(i_{13/2})$
- The adopted wave-function admits solutions of both **positive and negative parity**. Parity operator: $\mathcal{P} = \mathrm{e}^{-i\pi \mathbf{J}_2} C$:

$$\mathcal{P}\Psi(r,\varphi;t,\psi) = \Psi(r,\varphi+\pi;t,\psi+\pi)\ ,$$
$$\mathcal{H}(r,\varphi+\pi;t,\psi+\pi) = \mathcal{H}(r,\varphi;t,\psi)\ ,$$
$$\Psi(r,\varphi+\pi;t,\psi+\pi) = \pm\Psi(r,\varphi;t,\psi).$$

R. Poenaru, A.A. Raduta, International Journal of Modern Physics E 30, 2021.

New band structure in ^{163}Lu

$$\begin{aligned}
E^{\text{TSD1}}_{I,0,0} &= \epsilon_{13/2} + \mathcal{H}^{I}_{\min} + \mathcal{F}^{I}_{00}\ ,\ \ I^\pi = 13/2^+, 17/2^+, 21/2^+ \ldots\ ,\\
E^{\text{TSD2}}_{I,0,0} &= \epsilon^{1}_{13/2} + \mathcal{H}^{I}_{\min} + \mathcal{F}^{I}_{00}\ ,\ \ I^\pi = 27/2^+, 31/2^+, 35/2^+ \ldots\ ,\\
E^{\text{TSD3}}_{I,1,0} &= \epsilon_{13/2} + \mathcal{H}^{I-1}_{\min} + \mathcal{F}^{I-1}_{10}\ ,\ \ I^\pi = 33/2^+, 37/2^+, 41/2^+ \ldots\ ,\\
E^{\text{TSD4}}_{I,0,0} &= \epsilon^{2}_{13/2} + \mathcal{H}^{I}_{\min} + \mathcal{F}^{I}_{00}\ ,\ \ I^\pi = 47/2^-, 51/2^-, 55/2^- \ldots .
\end{aligned}$$

Band	n_s	$\mathbf{j}_{\mathcal{Q}}$	$\mathbf{R}_{\mathscr{C}}$ - Sequence	$\mathbf{I}$ - Sequence	Coupling
TSD1	21	$\mathcal{Q}_1$	$\mathscr{C}_1 = 0^+, 2^+, 4^+, \ldots$	$13/2^+, 17/2^+, 21/2^+, \ldots$	$\mathscr{C}_1 + \mathcal{Q}_1$
TSD2	17	$\mathcal{Q}_1$	$\mathscr{C}_2^+ = 1^+, 3^+, 5^+, \ldots$	$27/2^+, 31/2^+, 35/2^+, \ldots$	$\mathscr{C}_2^+ + \mathcal{Q}_1$

TSD4	11	$\mathcal{Q}_1$	$\mathscr{C}_2^- = 1^-, 3^-, 5^-, \ldots$	$47/2^-, 51/2^-, 55/2^-, \ldots$	$\mathscr{C}_2^- + \mathcal{Q}_1$

R. Poenaru, A.A. Raduta, International Journal of Modern Physics E 30, 2021.

New results for ^{163}Lu

Model requires **a unique set of parameters**: $\mathcal{P}_{\text{fit}} = [\mathcal{I}_1, \mathcal{I}_2, \mathcal{I}_3, V, \gamma]$.

$\mathcal{I}_1$ [$\hbar^2$/MeV]	$\mathcal{I}_2$ [$\hbar^2$/MeV]	$\mathcal{I}_3$ [$\hbar^2$/MeV]	γ [deg.]	V [MeV]
72	15	7	22	2.1

Remarks

- **+** overall $E_{RMS} \approx 79$ keV: **first semi-classical description for a nucleus with deviations smaller than** 100 **keV**.
- **+** γ in agreement with exp. value ($\gamma_{exp} = 20^\circ$, *Jensen, 2004*)
- **?** slight *decrease* of V (breaking of parity symmetry quenches the quadrupole deformation)
- **−** $\epsilon^{\mathbf{1}}_{\mathbf{13/2}}$ and $\epsilon^{\mathbf{2}}_{\mathbf{13/2}}$ agree with microscopic calculations

Minimal point	θ [rad]	φ [rad]	A_k ordering
m_1	$\pi/2$	0	$A_3 > A_2 > A_1$
m_2	$\pi/2$	π	$A_3 > A_2 > A_1$
m_3	$\pi/2$	2π	$A_3 > A_2 > A_1$

Semi-classical feature

This is the first geometrical description of the *wobbling stability* for an odd-mass nucleus.

3D interpretation of the WM

- Formalism $\mathbf{W}_2$ gives a 3D interpretation of the nuclear wobbling motion
- **Classical Trajectories**: intersection curves between the **triaxial energy** and the **total angular momentum**

$$I^2 = x_1^2 + x_2^2 + x_3^2,$$

$$E = \left(1 - \frac{1}{2I}\right) A_1 x_1^2 + \left(1 - \frac{1}{2I}\right) A_2 x_2^2 + \left[\left(1 - \frac{1}{2I}\right) A_3 + A_1 \frac{j}{I}\right] x_3^2 - $$

$$- I\left(I - \frac{1}{2}\right) A_3 - 2A_1 Ij + {\color{red}T_{\text{rot}}} + {\color{blue}T_{\text{sp}}}.$$

Outline

New Boson Method for odd-mass nuclei

Rotational Hamiltonian

$$\hat{H}_{\text{rot}} = AH' + H_{sp} + H_{\text{crank}},$$

$$H' = a_1\left(\hat{I}_+^2 + \hat{I}_-^2\right) + a_2\left(\hat{I}_+\hat{I}_- + \hat{I}_-\hat{I}_+\right) + a_3\hat{I}_1\ ,$$

$$H_{sp} = \sum_{k=1}^{2} A_k\hat{j}_k^2\ ,\ H_{\text{crank}} = A_1 I^2 - A_2 j_2 I\ .$$

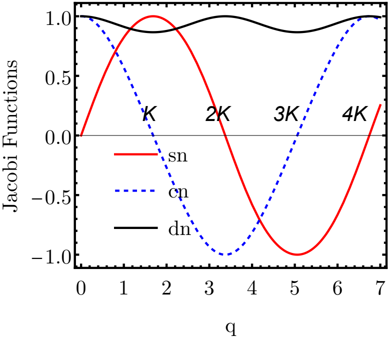
- the triaxial rigid rotor is constrained to move around the 1-axis.
- adopted Frozen-Alignment approximation: $\mathbf{j} = (j\cos\theta, j\sin\theta, 0)$ (*Frauendorf, 2014*)
- a_1, a_2, a_3 inertial properties of the nucleus (i.e., $A_{1,2,3}$)

New angular momentum representation

First boson expansion of this kind in literature:

$$\hat{I}_+ = i\frac{cb^\dagger - db^\dagger}{sb^\dagger}\left(I + Icb^\dagger db^\dagger - sb^\dagger b\right) ,$$
$$\hat{I}_- = i\frac{cb^\dagger + db^\dagger}{sb^\dagger}\left(I - Icb^\dagger db^\dagger + sb^\dagger b\right) ,$$
$$\hat{I}_1 = Icb^\dagger db^\dagger - sb^\dagger b .$$

- s, c, d : **Jacobi Elliptic Functions** (*Jacobi, 1829*)
- $b, b^\dagger, [b, b^\dagger] = 1$: boson operators (*Bargmann, 1962*)



Elliptic Potential

New Hamiltonian

$$H' = -\frac{d^2}{dq^2} - 2v_0 s\frac{d}{dq} + I(I+1)s^2k^2 + 2v_0 cdI \ ,$$

with the associated *Schrodinger Equation* (fully separated Kinetic and Potential terms):

$$\left[\frac{d^2}{dq^2} + V(q)\right]\Psi = E\Psi.$$

$$V(q) = \left[I(I+1)k^2 + v_0^2\right]s^2 + (2I+1)v_0cd = V(-q) \ . \qquad (1)$$

Results were presented at the **International Conference TIM-22** (Timisoara) and **World Quantum Day 2023** (IFIN-HH)

Elliptic potential

$\mathcal{I}_1$	$\mathcal{I}_2$	$\mathcal{I}_3$	θ [degrees]	N.o. states	RMS [MeV]
91	9	51	-119	20	0.174

A.A. Raduta, C.M. Raduta, **R Poenaru**, Journal of Physics G 48, 2020.

Outline

General Conclusions

- Developed **three** semi-classical models that describe wobbling motion in odd-A nuclei ($\mathbf{W}_1$, $\mathbf{W}_2$, and the boson method applied to ^{135}Pr).
- Showed that it is possible to treat the motion of the core and the odd nucleon separately.
- Obtained realistic results concerning wobbling energies and other quantities.
- Special attention to the geometrical interpretation of the wobbling motion was given for ^{163}Lu.

Original Contributions

- Research period: 2018-2023
- **7** ISI papers (2 RJP, 1 IJMPE, 2 PRC, 2 JPG)
- **38** Citations
- **Total IF:** 17.225 ; **Total AIS:** 4.684
- **5** Oral and **2** Poster presentations at international conferences
